

Gestione peri-operatoria del paziente in terapia con antagonisti della vitamina K

B. Cosmi

Department of Angiology and
Blood Coagulation
S. Orsola-Malpighi University Hospital
Bologna, Italy

Overview

- Background and general framework to manage vitamin K antagonists (VKA) in the peri-operative setting
- Bridging anticoagulation: definition, aim, and dose regimens
- Literature evidence on efficacy and safety of bridging
- Guideline recommendations

Rationale for peri-operative bridging of VKAs

- VKAs have a slow offset and onset, when stopped and then restarted around the time of a procedure
- There is a period during which therapeutic anticoagulation is not achieved.
- To minimize this time, bridging therapy is often used.

Perioperative Management of Antithrombotic Therapy

Antithrombotic Therapy and Prevention of Thrombosis, 9th ed: American College of Chest Physicians Evidence-Based Clinical Practice Guidelines

- No universally accepted definition
- ♣ bridging anticoagulation = administration of a short-acting anticoagulant, consisting of SC LMWH or IV UFH, for a ~ 10- to 12-day period during interruption of VKA therapy when INR is not within a therapeutic range.
- Bridging therapy itself must also be interrupted during the time of the procedure, but the shorter half lives of the drugs used for bridging treatment enable the time off all anticoagulation to be minimized.

Douketis JD et al, CHEST 2012; 141(Suppl):e326S

Peri-operative management of VKA: balancing the competing risks

thromboembolic risk
without VKA:
depending on:
indication for treatment

2Risk of bleeding
after restarting VKA
Stratification on the basis of:
-type of procedure

3-

basis for determining whether antithrombotic therapy is interrupted and, if so,whether bridging anticoagulation is considered

Procedural bleeding risk

High risk two day risk of major bleed 2-4%

Heart valve replacement Coronary artery bypass

Abdominal aortic aneurysm repair Neurosurgical, urologic, head and neck, abdominal, or breast cancer surgery

Bilateral knee replacement

Laminectomy

Transurethral prostate resection

Kidney biopsy

Polypectomy, variceal treatment, biliary sphincterotomy, pneumatic dilatation

Placement of a percutaneous endoscopic gastrostomy tube

Endoscopically guided fine needle aspiration

Multiple tooth extractions

Vascular and general surgery

Any major operation (duration >45

minutes)

Daniels PR, BMJ 2015;351:2391

Procedural bleeding risk

Low

Two day risk of major bleed 0-2%

Cholecystectomy
Abdominal hysterectomy
Gastrointestinal endoscopy with or
without biopsy, enteroscopy, biliary or
pancreatic stent without
sphincterotomy, endosonography
without fine needle aspiration
Insertion of a pacemaker or cardiac
defibrillator and electrophysiologic
testing
Simple dental extractions

Simple dental extractions
Carpal tunnel repair
Knee or hip replacement and
shoulder, foot, or hand surgery
Arthroscopy

Dilatation and curettage
Skin cancer excision
Abdominal hernia repair
Hemorrhoidal surgery
Axillary node dissection
Hydrocele repair
Cataract and non-cataract eye surgery
Non-coronary angiography
Bronchoscopy with or without bio

Bronchoscopy with or without biopsy Removal of a central venous catheter Skin, bladder, prostate, thyroid, breast, and lymph node biopsies

Daniels PR, BMJ 2015;351:2391

Thromboembolic risk without anticoagulants

High	Moderate	Low
> 10% / year	5-10% / year	< 4% / year
Prosthetic heart valve: • Any mitral valve type Older type aortic valve (caged ball, tilting disk) • Recent stroke/TIA (<6 months)	Bi-leaflet aortic valve and any of the following: atrial fibrillation, prior stroke, age > 75,diabetes mellitus,hypertension, congestive heart failure	Bi-leaflet aortic valve without atrial fibrillation or other risk factors for stroke
Atrial fibrillation: CHADS2 score 5-6 Recent stroke/TIA (<3 months) Rheumatic valve disease	Atrial fibrillation: • CHADS2 score 3-4	Atrial fibrillation: • CHADS2 score 0-2 no previous stroke or TIA
Recent venous thrombo- embolism (<3 months), severe thrombophilia		Venous thromboembolism >12 months, reversible risk factors
	Daniels PR,	BMJ 2015;351:2391

Bridging dose regimens

- ➡ Therapeutic dose: similar to that used for the treatment of acute VTE or ACS (eg, enoxaparin 1 mg/kg bid or 1.5 mg/kg daily, IV UFH to attain an aPTT 1.5 to 2 times the control aPTT: greatest therapeutic benefit with the potential of greatest harm
- A low-dose (prophylactic-dose) heparin regimen: administering a dose that is used, typically, to prevent postoperative VTE
- An intermediate-dose regimen: intermediate in anticoagulant intensity between high- and low-dose regimens (eg, enoxaparin 40 mg/kg bid)

Douketis JD et al, CHEST 2012; 141(Suppl):e326S

Evidence on bridging

- **Most** of the data from observational studies of limited quality with variable outcome definitions, bridging therapy regimens, procedure types, and patient characteristics.
- Systematic reviews
- **4** RCTs:
- **♣Bruise Control 2013**
- **♣Bridging Anticoagulation for Surgery (BRIDGE) (NEJM 2015)**
- ♣A Safety and Effectiveness Study of LMWH Bridging Therapy Versus Placebo Bridging Therapy for Patients on Long Term Warfarin and Require Temporary Interruption of Their Warfarin (PERIOP-2)

Perioperative Bridging Anticoagulation in Patients with Atrial Fibrillation

The Bridge Investigators

- Few patients with CHADS2 score of 5 or 6, mean score of 2.3
- #mechanical heart valves excluded
- ♣major surgical procedures associated with high rates of arterial thromboembolism and bleeding (e.g., carotid endarterectomy, major cancer surgery, cardiac surgery, or neurosurgery) not represented
- **4**overall rate of arterial thromboembolism (0.4%) lower than expected
- ₄observed rate of major bleeding in the bridging group (3.2%, with no instances of fatal bleeding) may be considered to be modest
- ♣the reduction in the study sample size may raise concerns

- *prospective multicentre randomized double-blind controlled trial in 11 teaching hospitals in Canada.
- 1773 patients with
- prosthetic heart valves receiving warfarin or
- patients with atrial fibrillation/flutter and a major risk factor
- **♣**Dalteparin, a LMWH, at 200 IU/kg sc early in the morning for the 3 days prior to, but not including the day of, the procedure except on the day prior to surgery the dose will be 100 I.U./kg given 24 hours preoperatively. Warfarin will be resumed the evening of the procedure. VS placebo
- Primary outcomes: major thromboembolism over a 90-day follow-up.
- Secondary outcomes: major bleeding and overall survival.

Major guidelines

- ♣ American College of Cardiology and American Heart Association (ACC/AHA) guideline (2014) : in general agreement with those from the ACCP
- no bridging therapy in one bileaflet aortic mechanical valve only who have none of the following risk factors:
- AF, previous thromboembolism, "hypercoagulable condition," older generation-type prosthesis, or LVEF 30% or less.
- ♣Bridging therapy recommended in patients with a mitral, tricuspid, or aortic mechanical heart valve who have any of the risk factors listed above.
- ♣If LMWH is used as bridging therapy, then twice daily dosing and last dose 12 hours before surgery is recommended

Major guidelines

- **LESC 2014 : recommends interrupting warfarin 5 days before** and recommends considering bridging therapy in patients with a mechanical heart valve or AF who are at high risk of thromboembolism
- **4BCSH 2011:** potential harm of postoperative bridging therapy and states that for procedures with a high risk of bleeding, bridging therapy should be given only 48 hours or more after the procedure.
- **♣**For patients who have had a VTE more than three months earlier the BCSH recommends prophylactic doses of LMWH rather than therapeutic dose bridging therapy.
- **♣**No bridging therapy for patients with AF and no history of stroke or a transient ischemic attack or for patients with a bileaflet aortic mechanical valve and "no other risk factors."

Standardized Low-Molecular-Weight Heparin Bridging Regimen in Outpatients on Oral Anticoagulants Undergoing Invasive Procedure or Surgery An Inception Cohort Management Study

Pengo V et al, FCSA.Circulation 2009

- high thromboembolic risk:
- mechanical mitral valve prostheses, monoleaflet mechanical aortic prostheses or bileaflet aortic prostheses associated with AF or previous arterial embolism,
- 4 AF associated with previous arterial thromboembolism or mitral valve disease, previous cardiogenic or unexplained systemic embolism, and venous thromboembolism in the previous 3 months.
- All other cases were considered low to intermediate thromboembolic risk.

Standardized Low-Molecular-Weight Heparin Bridging Regimen in Outpatients on Oral Anticoagulants Undergoing Invasive Procedure or Surgery An Inception Cohort Management Study

Standardized Low-Molecular-Weight Heparin Bridging Regimen in Outpatients on Oral Anticoagulants Undergoing Invasive Procedure or Surgery An Inception Cohort Management Study

Pengo V et al FCSA .Circulation 2009

- Five thromboembolic events (0.4%; 95% CI, 0.1 to 0.9), 3 venous and 2 arterial, were recorded during follow-up
- ♣ All events occurred in high-thromboembolic-risk patients,1 fatal.
- 15 episodes of major bleeding (1.2%; 95% CI, 0.7 to 2.0)
- ♣ All events were postprocedural, and none was fatal. Most of the bleeding episodes (11 of 15) were overt surgical site bleeding, and 9 required the transfusion of ≥2 U packed red blood cells.
- 8 occurred in the 295 cases bridged with protocol A (2.7%) and 7 in the 967 cases bridged with protocol B (0.7%; P= 0.011)
- Major bleeding was associated with twice-daily LMWH administration (high-risk patients) but not with the bleeding risk of the procedure

Updated European Heart Rhythm Association Practical Guide on the use of non-vitamin K antagonist anticoagulants in patients with non-valvular atrial fibrillation

	Dabigatran		Apixaban-edoxal	ban-rivaroxaban			
		No important bleeding risk and/or adequate local haemostasis possible: perform at trough level (i.e. ≥12 or 24 h after last intake)					
	Low risk	High risk	Low risk	High risk			
CrCl ≥ 80 mL/min	≥24 h	≥48 h	≥24 h	≥48 h			
CrCl 50-80 mL/min	≥36 h	≥72 h	≥24 h	≥48 h			
CrCl 30-50 mL/min ^a	≥48 h	≥96 h	≥24 h	≥48 h			
CrCl 15-30 mL/min ^a	Not indicated	Not indicated	≥36 h	≥48 h			
CrCl < 15 mL/min		No official indicat	ion for use				
There is no need for bridging w	ith LMWH/UFH						
	n stopping rule of \geq 24 h low risk, \geq 48 eding and/or minor impact of a bleedin						

DOACs may be restarted 6 to 8 after a procedure if immediate and complete hemostasis, but it notes that resumption of therapeutic dose anticoagulation in the first 48-72 hours after a procedure may increase the risk of bleeding. For patients who are immobile after a procedure, EHRA recommends considering prophylactic LMWH until DOACs restarted.

Heidbuchel H et al, Europace 2015
